## greenbets esta fora do ar

Hello guys,

Been watching from the "shadows" for a while. I thought it's about time I post my first thread in here since I need some help deciding on some parts.

So question

is, I want to build a high performance and stable Windows 98SE computer, mainly focused on running old games and software.

I will try to make it as simple as possible:

- The

games I want to run are from the '95-'03 era.

- DirectX 8.1 compatibility is a must

since I want to run some games like Halo for example that need it.

- No Windows XP, the

rig focuses on Win 98 only.

- I don't really care that much about DOS compatibility

since I only want to run some of the classics like Duke, Wolfenstein and Doom.

- AGP 8x

Support, I'm not fond of the idea of running PCI Graphic Cards with Windows 98.

- I

don't really care that much about period correctness but Socket 939 for example seems a bit too much for Win98 imo.

I already have a Socket 462 Athlon XP 2200+ rig which runs

pretty stable. Games work alright but not exactly how I would like them to ( Mainly because of the GPU: Radeon 9600 SE ) and the other parts also aren't necessarily great.

There is also an Async between the CPU, Mobo and RAM FSB frequencies and this annoying bug with the current Mobo: sound crackling in some games which as far as I have researched may come from some incompatibilities with the VIA KT400 Chipset. I thought maybe another Socket A build ( but this time with a Barton 3200+, nForce 2

Chipset, FSB Sync between parts and a powerful Graphics Card ) should do the trick. I have also found some pretty decent Socket 462 Mobo's I can start with like: GIGABYTE GA-7N400E, GA-7VA, GA-7N400SL, 7VT600P-RZ but only two of them support 400 Mhz FSB for the Barton 3200+ which is kind of mandatory for running everything in sync. The Barton 3200+ is also a bit too expensive where I live (40 EUR) and I'm really starting to question if it is worth it or not + having to wait for other deals and parts to appear.

While looking into some Socket 754 Parts, I have only stumbled upon parts that that either have what I need but PCI instead of AGP, SATA only etc. or cheap low end ones but which got AGP and IDE ports for example.

If I go the 754 Route, I will

probably pair it with an Athlon 64 3200+ CPU which AFAIK can also have some compatibility issues with Windows 9x hence it being too new and then having to turn off various BIOS features and will also have to wait and find a decent Mobo that has an AGP port and which also isn't unjustifiably expensive.

But now I cannot decide if I should

stick with Socket A again or cross the line into the XP territory with the Socket 754/939 but this time for Win98 and risk headaches with downclocking or configuring things to work with each other.

What do you guys suggest ?

Thanks for all your

input.
